PATTERN & INTERVAL TRAINER

Train patterns. Master the fretboard.

Guitar Neck Pilot

Pattern & Interval Trainer - User Manual 1.0.0

Train patterns. Master the fretboard.

1. Purpose

Guitar Neck Pilot trains interval recognition inside repeating abstract guitar-neck patterns. The exercise intentionally hides note names and fret numbers, reducing dependence on fixed positional memory.

The target circle marks one playable cell. Select the interval that belongs to that cell as accurately and quickly as possible.

2. Starting a training round

Open `index.html`, choose an active pattern and select left- or right-handed presentation. Leave Willekeurige startpositie enabled to shift the repeating pattern at the beginning of each round.

Select Nieuwe ronde. The trainer presents 30 questions by default. The live dashboard shows score, correct answers, progress, elapsed time and state.

3. Answering and scoring

The marked cell remains visible until an answer is selected. Green feedback indicates a correct answer and red feedback indicates an incorrect answer.

Performance scoring combines accuracy with response time. With equal accuracy, a faster round always scores higher; with equal speed, a more accurate round always scores higher.

4. Pattern Library

Use Schaalbibliotheek to activate built-in patterns, create a custom scale from an existing structure, duplicate a scale or remove a custom scale. Built-in patterns are protected.

The Pattern Designer edits the six-by-sixteen matrix. Each active cell contains a visual pattern group and an interval answer. Save only after checking that the pattern contains playable cells and valid intervals.

5. Import and export

Custom patterns can be exported as JSON for backup or transfer. Import validates the file and handles duplicate names. Keep exported files with your normal backups.

6. Statistics

The statistics dashboard stores completed rounds locally. Filters provide per-scale, recent-round and interval-level views. Clearing statistics is permanent after confirmation.

7. Training advice

Practice frequently in short sessions. Keep randomized starts enabled, alternate patterns, and avoid reasoning from the left or right edge. The goal is immediate relational recognition rather than conscious counting.

8. Data and privacy

No account is required. Settings, custom patterns and statistics remain in the current browser's LocalStorage. Clearing browser site data can remove them, so export custom patterns before browser maintenance.
